

Internet Explorer 10 Emulation Mode

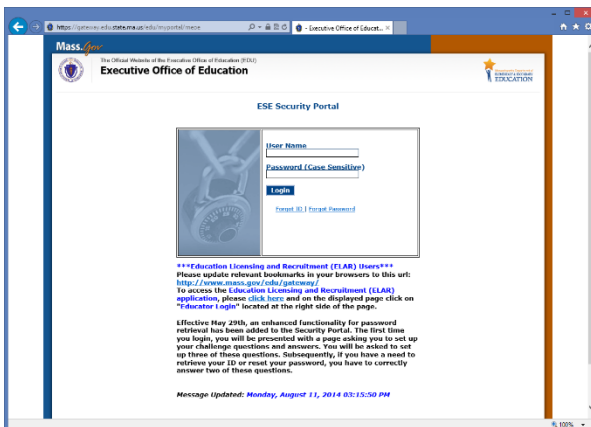

From time to time when viewing sites on the internet you may be told to use various browsers or older versions. This is because the website you are visiting hasn't updated their site to be compatible with the modern versions. Sometimes using Chrome bypasses this problem, however, once you move to chrome you find other sites just don't work right.

Luckily Internet Explorer 10 has the ability to emulate older versions, this often lets you access the website and view your data.

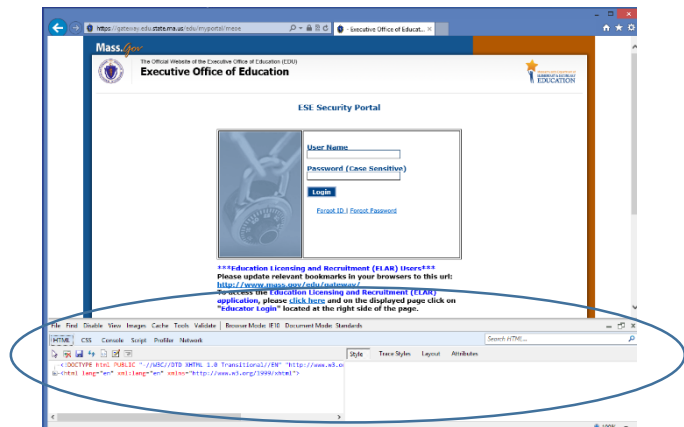

***This is a common thing with various parts of the EOE security portal including Edwin Analytics.**

In IE 10 to enable emulation navigate to the website that is having problems, once there press the F12 key. It should bring up a new menu bar in the bottom part of the screen such as below.

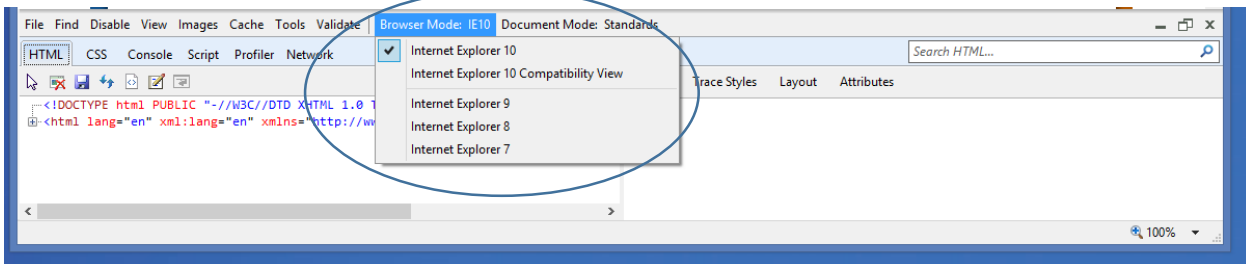

Screen before F12 was pressed

Screen after F12 was pressed (Notice the circle area)

After you pressed F12 click where it says Browser Mode in the tool bar, and select a different option, you can continue to select alternative options until it works. It is highly recommended that you start with the highest version first and work your way backwards should it be needed.

Once you have made your selection you can then minimize this window, X-ing out disables the emulation.
